

REI PRODUCT INFORMATION

HIKING

FOOTWEAR

QUICK TIPS

Keep weight low. If, for example, you usually take day hikes, you don't need mountaineering boots.

Hiking footwear includes stock insoles. Enhanced insoles (such as Superfeet®) are sold separately and offer an elevated degree of support.

Wear new boots indoors and then on short trips before a major hike. Proper break-in helps prevent blisters.

CATEGORIES

Light hiking footwear is very flexible and designed principally for day hikes. Light hikers often resemble beefed-up trail-running shoes. Some ultralight, long-distance travelers wear light hikers exclusively on all their treks.

Hiking footwear is intended for day trips or longer journeys with a light load. Such shoes (or lightweight boots) offer good flexibility, cushioning and breathability, but less support and durability than backpacking boots.

Backpacking boots are built for all varieties of loads, on or off trail. They are durable and supportive and have varying degrees of flex. They usually require some break-in time.

Mountaineering boots, with stiff midsoles, are designed for moderate to heavy loads, on or off trail. Tough, supportive and durable, they are stiff enough to accept crampons.

WHICH CUT IS RIGHT FOR YOU?

Low-cut footwear is fine for lightweight travel but provides less roll-resistance for ankle joints. Plus, on muddy routes or trails filled with scree, grit or sand, it's tough to keep debris out of low-cuts. They're a good choice for lighter loads on maintained trails.

Mid-cut boots wrap around your ankle and offer some cushioning and protection from debris and hazards. They're a smart pick for shorter multiday trips with moderate loads.

High-cut boots give you leverage and ankle support on irregular trails or cross-country terrain. If you routinely carry heavier loads, high-cuts make sense. Take the time to break them in before starting a long-distance trip.

HOW DO UPPER MATERIALS DIFFER?

Full-grain leather is tops for durability and abrasion resistance, and it resists water very well. It can require extended break-in time.

Split-grain leather splits away the inner part of the cowhide from the smooth exterior. It's lighter and breaks in faster than full-grain; it's a little less resistant to water and abrasion.

Nubuck leather is full-grain leather buffed to resemble suede. Very durable; resists water and abrasion. It may need some break-in time.

Synthetic materials are lighter than leather, break in quickly and cost a bit less, though they may show wear sooner.

WATERPROOF/BREATHABLE LININGS

Some shoes and boots include waterproof/breathable membranes (such as Gore-Tex XCR³ or eVent³) bonded to the uppers. This keeps feet drier in wet environments with a slight trade-off in breathability.

MIDSOLE MATERIALS

Midsoles of hiking footwear usually include EVA (ethylene vinyl acetate) or polyurethane. Both absorb shock and provide cushioning. Generally, EVA is a bit lighter; polyurethane is a little more durable.

SUPPORT COMPONENTS

Shanks: Steel, plastic or nylon inserts that add load-bearing stiffness to a midsole.

Plates: Thin, semiflexible inserts that 1) help stabilize the forefoot and 2) protect feet from getting bruised by roots or uneven rocks.

TPU: Thermoplastic urethane; commonly used in flexible plates/stabilization devices.

OUTSOLE MATERIAL

Rubber or Vibram[®] rubber is used on most outdoor footwear. Vibram outsoles are known for their grip and durability.

CAN FOOTWEAR BE RESOLED?

Yes for Mountaineering boots. Almost always yes for Backpacking boots. No for Light Hiking footwear. Why? New-generation materials and designs lack the structure necessary to accept new soles. Plus, resoling can be costly, reducing its suitability for lower-cost footwear.

In Hiking footwear, opinions vary on which models can or cannot be resoled. Our advice: Have a local cobbler evaluate your footwear. If none is available, one option is Seattle-based cobbler Dave Page (davepagecobbler.com).

FIT CONSIDERATIONS

A good fit involves 1) foot length, 2) width and 3) volume. Length and width can be measured with a Brannock Device. An REI sales specialist can help you evaluate the volume of your foot.

Volume is the space your foot occupies, top to bottom, inside a shoe. A high-volume foot may feel snug in some footwear; a low-volume foot may feel too loose. If you have a high instep (the top of your foot near your ankle), you likely have a high-volume foot.

Different boots will fit different combinations of width and volume. A good fit allows you to easily wiggle your toes inside the footwear.

Feet should not slide inside footwear. Good-fitting boots hold feet firmly without binding.

Walk on inclines and declines. If you detect heel-lift on inclines, adjust lace tension atop the insteps and check again. On declines, toes should not feel too compacted in the toebox.

Tips: Bring along familiar hiking socks when sampling footwear. And try on footwear later in the day; feet tend to swell a bit during a day.
