SLEEPING

BAGS

QUICK TIPS

Select a bag with a comfort rating for the coldest temps you expect to encounter. When in doubt, choose a bag rated for colder conditions.

Down is the lightest, warmest, most compressible fill per ounce. Synthetic insulations are nearly as light. Their advantages: They're more economical, retain warmth even when wet and dry faster.

Women-specific bags are shaped for women, and extra insulation is often added in key areas.

To find our most complete selection of bags, visit REI.com.

COMFORT RATING

A comfort rating identifies the lowest temperature at which the bag will keep average sleepers warm. For instance, a bag rated +20°F suggests most people should remain comfortable when air temperature drops no lower than 20°F/-6°C. Each manufacturer assigns its own comfort rating.

These ratings are based on the sleeper wearing a layer of long underwear and using a sleeping pad with the bag. Use these numbers as a guide, not a guarantee.

Weight: When backpacking, you want to keep bag weight low, but without jeopardizing comfort or safety. Individual views on comfort and weight, of course, can vary greatly. So REI divides core gear (bag, pack and tent) into four general categories. The goal: to help you build a gear system matched to your preferences.

Minimalist: Low weight overrides all other concerns (comfort, durability, convenience).

Ultralight: Gear for those willing to forego some conveniences to reduce pack weight.

Lightweight: Traditional gear redesigned with new-generation, low-weight materials.

Deluxe: For "maximalist" explorers who put a priority on comfort and convenience features.

TYPES OF INSULATION

GOOSE DOWN

Down, as defined by the International Down and Feather Laboratory (Salt Lake City), is the plumage that forms the undercoating of waterfowl—tufts of fluffy filaments growing from one quill point (minus the quill shaft).

Goose down is high-quality down—very light, easily compressible, durable and breathable. It excels in cold, dry conditions, or any time weight and packability are top priorities.

Down's ability to loft (which enables it to trap heat) is measured in "fill power"—the volume (in cubic inches) occupied by an ounce of down in a controlled setting (a lab cylinder). The higher the fill power, the less down that is needed to achieve a given temperature rating.

For example, an 800-fill-power down bag rated +10°F will use less down (and thus weigh less) than a +10°F bag using 600-fill-power down. Because down with higher fill powers is less plentiful, it typically has a higher cost.

Shells of most down bags use fabrics that are treated with a durable, water-repellent (DWR) finish. This sheds light moisture. If down gets wet, it loses its ability to loft and insulate. In wet weather, ensure your bag is fully enclosed in its stuff sack. In camp, store it in your tent.

SYNTHETIC INSULATION

Synthetic insulators (usually polyester) retain some loft even when wet, so in a pinch you can get through a night in a damp bag. They are also quick to dry, nonallergenic and less expensive. Conversely, they are a bit heavier than down and don't pack as compactly.

Synthetic insulation is typically used as a continuous filament or as short-staple fibers. Thicker, durable continuous filaments (usually 6-denier) provide high lofting ability. Short-staple fibers (thinner, or sometimes a mix of deniers) compress more easily. Both do an excellent job of trapping body heat.

PrimaLoft® Sport: A premium polyester constructed with ultrafine short-staple fibers. These dense, low-bulk fibers create millions of tiny heat-trapping air pockets. It is soft, light and highly water resistant, and it packs small.

Polarguard® Delta: The latest insulation from Polarguard; a long, continuous polyester filament with a delta-shaped, heat-trapping air space inside; light and thermally efficient.

Other synthetics (Polarguard® 3D, CloudLoft®, Quallofil® and assorted generic brands) are also sometimes used.

FEATURES

- Hoods can prevent heat from radiating away. Some hoods offer stuffable pillow pockets.
- Draft tubes behind the zippers keep heat in and cold drafts out.
- Draft collars (usually found on bags rated 0°F and below) are insulated tubes positioned just above your shoulders to prevent body heat from radiating up and out of a bag.
- Stash pockets are handy for keeping items such as watches and glasses close at hand.
- Pad locks or loops provide attachment points to hold the bag and pad together.

WOMEN'S BAGS

Women-specific bags are engineered to match a woman's contours, usually cut shorter, narrower at the shoulders and wider at the hip. Extra insulation is often added in the upper body and footbox. In recent years, the sleeping-bag options available to women have expanded dramatically.

Because women often sleep colder than men, it is not unusual for women to carry, say, a +10°F bag on the same trip where a male will carry a +20°F bag.

TIPS

- A good sleeping pad cushions and insulates you. It is essential for comfort and warmth. On snow, you may want two pads.
- Completely dry a bag after a trip. For long-term storage, leave it uncompressed, under a bed or stored loosely in its storage sack.
- A bag liner adds warmth and is easier to clean than the bag itself.
